Sign in with Quran ID

Partner integration kit — buttons, assets, colour, type and code for adding Quran ID to your app or website.

VERSION 1.0 · ENGLISH

ISSUED BY

Quran Foundation — the non-profit behind Quran.com

WHAT IS INSIDE

SVG, PNG, PDF and Android assets · CSS tokens · HTML, React, SwiftUI and Jetpack Compose

01 — SCOPE

What you build, and what we host

Quran ID uses a hosted login. Your app never sees the user's password, and you never build the sign-in form.

You build this

- ✓ **The button.** Placed wherever sign-in belongs in your product.
- ✓ **The entry card** — optional, recommended. A short explanation around the button.
- ✓ The OAuth call, and whatever you do with the identity afterwards.

We host this

- The sign-in screen and the create-account screen.
- The permission screen, where the user chooses what to share.
- Password handling, recovery, and the social providers.

Authorization Code with PKCE. Your app receives a token, never a credential.

Two rules that cover most of this document

1. Never rebuild the button. Use the supplied SVG. The label is already converted to outlines, so it cannot fall back to the wrong typeface and you do not need our fonts to render it.

2. Never recolour the mark. The mark is the word *Qur'an* in Arabic calligraphy. It appears in the two colourways in this kit and in no others.

Naming

The product is **Quran ID** — the account and the sign-in. Not "Quran Foundation account", not "QF account", not "QF OAuth". Use *Quran ID* in your interface, your docs and your support material.

02 — THE BUTTON

Four styles

Pick the one that keeps the pill distinct from whatever sits behind it.

Green — the default
White and light surfaces, and dark mode

Dark
Light surfaces where green competes with your brand. Used inside the entry card

White
On green, dark or busy surfaces

Black
Single-ink and monochrome contexts only

All four are the same 237×48 artwork; only the colours differ. SVG scales losslessly, so there is one file per colourway and none per size.

Size and spacing

One asset, scaled. Never redrawn.

PROPERTY	VALUE	NOTE
Native size	`237 × 48`	The exported artwork. Scale it; do not redraw it
Heights	`48 · 40 · 32`	px on web, pt on iOS, dp on Android — the same file at three heights
Minimum height	`32`	Below this the calligraphy fills in and stops reading
Minimum tap target	`44 × 44`	Pad around the button; do not grow the pill to reach it
Corner radius	`999`	Fully rounded, always. The pill is how it is recognised
Width	`auto`	Hugs the label. Never stretch, squash or crop
Clear space	`½ × height`	24px around a 48px button. Nothing sits inside it
Beside other providers	`8–12 gap`	Match their height exactly

States

STATE	TREATMENT
Hover	`filter: brightness(.94)`
Pressed	`filter: brightness(.88); transform: scale(.985)`
Focus	`3px solid #0B7557, offset 3px`
Disabled	`opacity: .5`

All four are in `code/web/quran-id.css`, and honoured by the React, SwiftUI and Compose components.

Accessible name

The button's name is always **"Sign in with Quran ID"** — as `alt` text on the image, or `aria-label` / `contentDescription` / `accessibilityLabel` on the control. Never leave it unnamed, and never name it "Sign in" alone.

What not to do

Every one of these has been seen in a real integration.

- ✕ **Do not set the words yourself.** Typing "Sign in with Quran ID" in whatever font is to hand, with the mark pasted beside it, is the most common mistake. Use the SVG.
- ✕ **Do not recolour the mark** to match your palette. Not gold, not your brand colour.
- ✕ **Do not stretch the button** to fill a container. Centre it, or pad around it.
- ✕ **Do not square the corners** to match your house style.
- ✕ **Do not add** a shadow, gradient, outline, glow or animation to the artwork.
- ✕ **Do not place** the green button on a green surface, or the white button on white.
- ✕ **Do not translate the label.** Each language is a separate piece of artwork, produced by Quran Foundation. Ask us and we will supply it.
- ✕ **Do not use the mark alone** unless the words "Quran ID" already appear beside it.
- ✕ **Do not rename it** to "Sign in with Quran Foundation", "Continue with QF", or anything else.

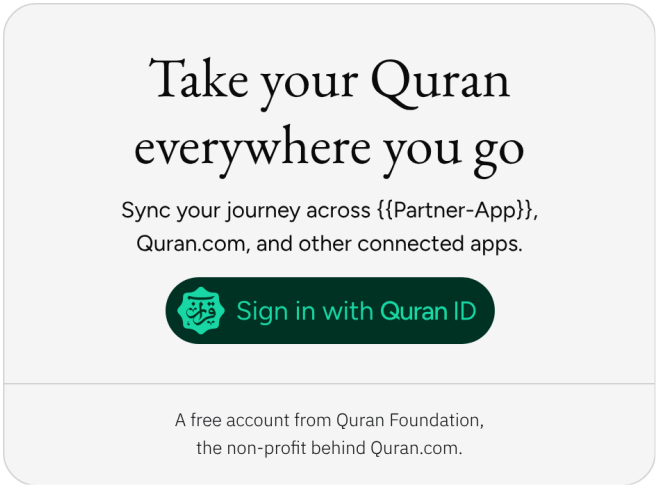
If the button genuinely will not fit

Use the 32px size before you consider anything else. If it still will not fit, talk to us rather than redrawing it — there is almost always an answer that does not involve a new asset.

04 — ENTRY POINT

The recommended pattern

Not required. The button on its own is always acceptable. Use this where you have room to say what Quran ID is. Note the card uses the **Dark** button; Green is for standalone placement.



470 × 347 · 24px radius · `#F8F8F8` on a `#D6D6D6` hairline
Shown at true proportions, rendered from the shipped code — not redrawn for this page.

Approved copy

If you build a different box, or write anything else that explains Quran ID, use this wording **exactly as written**. Only `{{Partner-App}}` is substituted.

```
headline
Take your Quran everywhere you go

subhead
Sync your journey across {{Partner-App}},
Quran.com, and other connected apps.

footnote
A free account from Quran Foundation, the
non-profit behind Quran.com.
```

Do not paraphrase, shorten or add to these lines. They have been through review.

Claims to avoid in your own copy

Signing in with Quran ID does not, on its own, carry a user's history into your app. Their bookmarks, notes, reading records and goals appear only for the features you implement and the user approves. Please do not write that Quran ID "syncs everything", and do not describe your app as endorsed, approved or certified by Quran Foundation.

Eight values, and no others

Ratios are WCAG 2.1 contrast, measured against the stated background. Do not derive your own tints or shades.

NAME	HEX	ON WHITE	USE
Quran ID Green	#1BDAA5	1.81:1	**Fill only.** Never text or links on white
Quran ID Dark	#003223	14.18:1	Fill, and content on green
Link Green	#0B7557	5.68:1	Green links on white — Reset password, Learn more
Link Green, hover	#08644A	7.16:1	Link hover and visited
Ink	#0A0B0D	19.69:1	Body and headings
Muted	#686C74	5.27:1	Secondary and helper text
Surface	#F8F8F8	–	Card and panel fill
Border	#D6D6D6	–	1px card edge and dividers

The one trap in this palette.

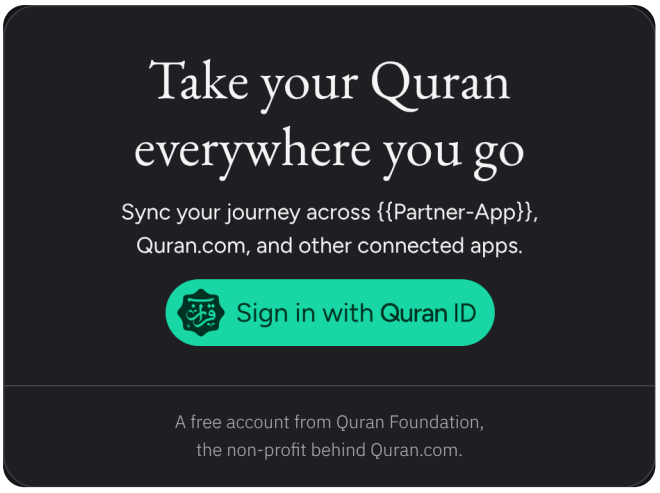
Quran ID Green is a *fill* colour. As text or a link on white it measures **1.81:1** — it fails WCAG AA by a wide margin and is close to unreadable for many people. For a green link on white, use **Link Green** `#0B7557`. If you need a green that is not in this table, you do not need a green.

Inside the button

Green on dark and dark on green both measure **7.85:1**, which clears AAA. That is why the artwork is fixed: any recolouring is very likely to break it.

Dark surfaces

Values resolved from the Quran Foundation design system, Mode - Color / Dark. These are the same tokens our own dark surfaces use — none of them are invented for this kit.



The same card on `#16171A`, using the **Green** button.

Which button on dark

STYLE	PILL VS CARD	
Green	8.92:1	Use this
White	16.12:1	Alternative
Dark	1.14:1	Never
Black	1.22:1	Never

The dark and black pills are almost exactly the value of the surface behind them. They do not read as buttons at all.

Dark values

TOKEN	HEX	USE
bg/canvas	#16171A	Page behind the card
bg/elevated	#1F2125	Card and panel fill
bg/recessed	#0A0B0D	Insets and wells
border/faint	#434548	White at 16% over bg/elevated
fg/bold	#F8F8F8	Headings and body — 15.18:1
fg/subtle	#B9BABE	Secondary text — 8.31:1
fg/faint	#86898F	Tertiary — 4.60:1, the floor
link	#1BDAA5	Links on dark — 8.92:1. The brand green works here

The one place the brand green earns its keep as a text colour. On white it fails at 1.81:1. On a dark card it measures 8.92:1 and is the correct link colour. The rule is about the background, not the colour.

In code: `code/tokens/quran-id.css` switches on `prefers-color-scheme`, or force a subtree with `.qid-theme-dark` / `.qid-theme-light`.

07 — TYPE

Four families, all free to use

Every one is licensed under the SIL Open Font License 1.1. Self-host them or load them from Google Fonts. Nothing here needs a licence purchase.

FAMILY	WEIGHTS	USED FOR
Figtree	400 · 500 · 600	Interface, buttons, body copy
EB Garamond	400	Display only — the entry-card headline. Never interface text
IBM Plex Sans	300 · 400	Fine print, legal lines, the free-account footnote
IBM Plex Mono	400	Small uppercase labels only. Never body copy

Never synthesise a weight

Do not apply faux bold or faux italic. If you ask a browser for `font-weight: bold` on a family where only Regular is loaded, it smears the outlines to fake it, and the result looks nothing like the brand.

For emphasis, load the next real weight up: Figtree Regular 400 → Medium 500 → SemiBold 600. EB Garamond and IBM Plex Mono have one weight each in this system — if you find yourself wanting a bolder one, the answer is a different size or a different family, not a heavier render of the same file.

Other rules

Minimum body size	13px. The footnote line is the smallest type in the system.
Letterspacing	None, anywhere, except IBM Plex Mono labels at +6 to +8%.
The button label	Outlined in the SVG. There is nothing to set, track or translate.
Apostrophes	Use the typographic apostrophe ’ not the straight quote ' — You’re, not You're.
Line length	Keep explanatory copy under about 62 characters a line.

Loading them

```
https://fonts.googleapis.com/css2?family=Figtree:wght@400;500;600&family=EB+Garamond:wght@400&family=IBM+Plex+Sans:wght@300;400&family=IBM+Plex+Mono:wght@400&display=swap
```

Assets

FOLDER	CONTENTS	USE IT FOR
`assets/svg/`	4 buttons · 2 lockups · 1 mark	**Web, and the source for everything else.** Label already outlined
`assets/png/`	@1x @2x @3x	Anywhere SVG is awkward. Email, docs, older toolchains
`assets/pdf/`	Vector PDF	**iOS.** Drop into the asset catalogue, tick Preserve Vector Data
`assets/android/`	drawable-mdpi → xxxhdpi	**Android**, if you would rather not convert. Rendered at 48dp

For Android we recommend converting the SVG instead: *right-click res → New → Vector Asset → Local file*. We ship the SVG rather than a hand-written VectorDrawable so the conversion is done by Android Studio rather than guessed at by us.

Code

PATH	WHAT IT IS
`code/tokens/quran-id.css`	Every colour, radius, height and font stack as CSS custom properties
`code/web/quran-id.css`	Button states, the entry card, the link style, a visually-hidden helper
`code/web/index.html`	A working page showing all three styles, all sizes and all states. Open it first
`code/react/QuranIdButton.tsx`	Typed component — `variant`, `size`, `assetBase`, forwarded ref
`code/react/QuranIdEntryCard.tsx`	The card, with the approved copy exported as `QURAN_ID_COPY`
`code/swiftui/QuranIDButton.swift`	Button, card, press feedback, the palette as `Color` extensions
`code/compose/QuranIDButton.kt`	Button, card, ripple, the palette as `QuranIDColors`

Fastest path

Open `code/web/index.html` in a browser. Everything in this document is on that one page, working. Copy the markup for the style you want, point `src` at your copy of the SVG, and you are done.

Checklist

Visual

- ✓ Button is the supplied SVG, not rebuilt
- ✓ Style chosen gives contrast against its surface
- ✓ Height is 48, 40 or 32 — nothing in between, nothing smaller
- ✓ Corners fully rounded
- ✓ Width hugs the label
- ✓ Clear space of half the height on all sides
- ✓ Mark is in its original colours
- ✓ Matches the height of any other provider buttons beside it

Accessible

- ✓ Accessible name is "Sign in with Quran ID"
- ✓ Tap target is at least 44×44
- ✓ Visible focus ring, not just a hover state
- ✓ Reachable and operable by keyboard
- ✓ No green text on white anywhere — only `#0B7557`
- ✓ Body text 13px or larger
- ✓ No faux bold or faux italic
- ✓ Honours reduced-motion
- ✓ On dark surfaces, the Green or White button — never Dark or Black

---

Copy

- ✓ Called "Quran ID" everywhere — never "Quran Foundation account" or "QF OAuth"
- ✓ Approved wording used verbatim, with only `{{Partner-App}}` substituted
- ✓ No claim that signing in brings a user's history across on its own
- ✓ No claim of endorsement, approval or certification by Quran Foundation

---
